

CERTIFICATE

In cooperation with Arqum GmbH the
greenhouse gas balance of HVL GmbH
at the site Badenweiler
was calculated for the year 2022.

The following emission sources were identified and accounted for:

- Scope 1: natural gas, fuels, refrigerants
- Scope 2: electricity
- Scope 3: fuel- and energy-related upstream supply chain emissions, purchased goods, travel by service providers, waste, business trips, employee commuting

For the year 2022 **36.418 kg CO₂e** greenhouse gas emissions were calculated.

The calculation was done in accordance with the requirements of the Greenhouse Gas Protocol Corporate Accounting and Reporting Standard. The emission factors used are largely taken from the databases Gemis, Defra and Ademe. The balance was calculated on the basis of activity data provided by the customer.

Despite research into accurate emission factors and careful calculation, deviations of the actual emissions from the calculated GHG balance cannot be completely ruled out, e.g. due to subsequent corrections of the emission factors, ambiguities in the supply chain, misleading data basis or unclear/unknown material composition.
